1. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.
2. Applicant is request to recite all references on IDS (form 1449) that are discussed in the specification and provided copy to the examiner.
3. The abstract of the disclosure is objected to the abstract does not set forth the nature and gist of the invention.

Correction is required. See MPEP § 608.01(b).

4. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.
5. Claim 28 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

As to Claim 28, It is noted that a single claim which claims both an apparatus and the method steps of using the apparatus is indefinite under 35

U.S.C. 112, second paragraph. In *Ex parte Lyell*, 17 USPQ2d 1548 (Bd. Pat. App. & Inter. 1990), a claim directed to an apparatus for measuring magnetic field and the method steps of using it was held to be ambiguous and properly rejected under 35 U.S.C. 112, second paragraph. (MPEP 2173.05 (p), Section II). Claim 28 recites a method according to one of the preceding claims. Claim 28 is indefinite as it claims both an apparatus and the method steps of using the apparatus.

6. Claim 28 is objected to because of the following informalities: The phrase "one of the preceding claims" is vague since previous claim (27) is an apparatus claim.

Appropriate correction is required.

7. Claims 16-27 and 29-30 are allowed.

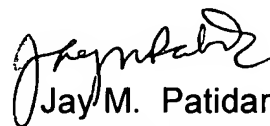

8. The following is a statement of reasons for the indication of allowable subject matter: The prior art fails to show Method for measuring magnetic field using a Hall sensor wherein the source is a voltage source of which an impedance is negligible for use of the sensor, and the processing circuit has a

negligible input impedance for tapping off the detection signal as a short-circuit current.
